

ABSTRACT
SHOE WITH AUTOMATIC CLOSURE

Shoe having a rear attachment element (5) joined to a
5 mobile support (6) that moves from an open position in
which it is separated from the heel of the foot and a
closed position in which it holds the heel piece, also
connected to a mechanism housed in said heel piece (3),
which mechanism can be actuated by applying pressure with
10 the heel of the user's foot on the heel piece (3) to
displace the mobile support (6) from the open to the
closed position, where it is kept by first retaining-
releasing means (10, 26, 50, 70, 90, 100, 110, 120, 130,
140, 150, 160), while the other foot of the user acts on a
15 member (24, 36, 51, 71, 91, 101, 111, 121, 131, 141, 151,
152) of the mechanism for moving said mobile support (6)
from the closed to the open position, where it is
maintained by second elastic retaining-releasing means (7,
25, 52, 72, 92, 102, 112, 122, 132, 142, 152, 162).
